Construction of a new forensic security centre Rheinau / Switzerland

Centre for forensic psychiatry Rheinau / Switzerland

Detailed view of the small secondary mesh

Project:	Security fencing / forensic
Site:	Rheinau / Switzerland
Object:	Construction of a new forensic security station
Description:	Three arched walkways for a forensic psychiatry centre
System:	ROMBO high-tensile steel wire mesh G 65/4 mm
Year of installation:	2006–2007

The new building is a single storey building with cutout pattern courtyards. The main areas of use organized on one level guarantee the necessary security plus optimal operating activities and create an environment appropriate to the therapy: The three stations, patients' living accommodation, are disposed around three garden courtyards. Inside the arched wire mesh walkways the patients are free to walk throughout the day because the ROMBO high-tensile steel wire mesh guarantees protection against break-outs. Small secondary mesh prevents it being penetrated by objects.

Geobrugg protects people and infrastructures

It is the task of our engineers (and partners) to analyze the problem together with you in detail and then, together with local consultants, to present solutions. Painstaking planning is not the only thing you can expect from us, however; since we have our own production plants on three continents, we can offer not only short delivery paths and times, but also optimal local customer service. With a view towards a trouble-free execution, we deliver pre-assembled and clearly identified system components right to the construction site. There we provide support, if desired, including technical support - from installation right on up until acceptance of the structure.
